

Use-Case Flow Specification

UC-02: Run Daily Domain Audit

Actors: SysAdmin, Security Officer

Supporting Actor: WHOIS Service

Preconditions

- Monitored domains and SSL endpoints are configured.
- Daily audit is scheduled and active.

Postconditions

- WHOIS and SSL/TLS results are recorded.
- Expiry alerts are generated when thresholds are reached.

Main Success Scenario

1. System starts the scheduled daily audit.
2. System retrieves the monitored domains and SSL endpoints.
3. System performs WHOIS checks and records domain expiry dates.
4. System performs SSL/TLS handshakes and records certificate expiry dates.
5. System checks expiry dates against configured thresholds.
6. System generates and escalates alerts when required.
7. System records the audit results and completes the audit.

Alternate Flow — Unreachable Endpoint

1. A domain or SSL endpoint cannot be reached.
2. System records the check as failed.
3. System continues auditing the remaining endpoints.
4. Failed checks are included in the audit results.
